Exceptional People, Exceptional Professionals

Health Enterprises' mobile stereotactic breast biopsy units offers physicians a reliable method of localizing and biopsying non-palpable mammographic lesions. This equipment is more expedient, less invasive and less expensive than open surgical biopsy. The technique is advantageous to women with suspicious, non-palpable mammographic lesions. The growing number of women who routinely undergo screening mammography has led to an increasing number of women who now require a biopsy.

Stereotactic breast biopsy offers a faster, more cost-effective way to perform this procedure with the added advantages of a shorter recovery time and less scarring.

Features and benefits include:

- No general anesthesia or sutures required
- Shorter procedure and recovery time
- No scarring or disfigurement
- No confusing scars on future mammograms
- Lower cost

The Fischer MammoTest Stereotactic Breast Biopsy System uses stereotactic images and a computer to help the physician direct a hollow-core needle into a questionable area in just a fraction of a second. The needle extracts several "cores" of tissue large enough for the pathologist to evaluate.

Mortality can be reduced if breast cancer is diagnosed before it is palpable. By using stereotactic breast biopsy, many women can avoid a surgical procedure since 80 percent of breast biopsies are benign. Health Enterprises' mobile stereotactic biopsy system uses stereoscopic three-dimensional digital images to pinpoint the location of a suspicious area seen on a mammogram.

Health Enterprises' Stereotactic Breast Biopsy System offers:

- Dedicated prone breast biopsy table
- SUROS ATEC™ biopsy system
- Customized software to assist with targeting
- Mammographic images to document biopsy site
